ABSTRACT

Cities are complex and interdependent systems, vulnerable to threats from natural hazards. Over recent years, sea-level rise, the increasing frequency of storms, and numerous other extreme precipitation events have all occurred, impacting on a large number of historic structures and increasing concern over risks due to weather patterns and global climate change.

Conservation of urban areas of historic value involves the management of change that, when properly addressed, is an opportunity to improve the quality of urban areas, ensuring the protection of social values as well as the authenticity and integrity of the physical material. Disaster risk reduction and adaptation to climate change should be seen as components of conservation, as they all share the objective of addressing the challenges of sustainable urban development.

The scope of this thesis is to analyse the impacts of flooding events caused by extreme precipitation and sea-level rise in urban areas with historic value, in order to prioritize interventions in the most sensitive areas.

A methodological approach for vulnerability and risk assessment has been developed, supported by an information strategy and a multi-scale urban model. The MIVES (Integrated Value Model for Sustainability Assessment) methodology was applied, in order to provide decision-making with objective and justified prioritization. The methodology delivers a balanced solution in terms of accurate results and data requirements, by using a categorization method for urban modelling. Information is organized and structured in hierarchical levels, permitting the comparison of building vulnerabilities and risks through the use of a unique index, thus facilitating the decision-making that is needed for the prioritization of efficient interventions.

ACKNOWLEDGMENTS

Firstly, I would like to express my sincere gratitude to my advisors, Prof. José Tomás San José and Prof. Maria Cristina Giambruno for their continuous support, patience, and motivation. Their knowledge and guidance helped me in all the phases of this research.

To Tecnalía, for the opportunity to involve myself as a researcher in such exciting projects and for the support during this last phase of the thesis. A special thanks to Maider Alzola, for believing in me and to Dr. Javier Urreta and Dr. Antonio Porro for giving me the possibility of working on this topic.

I gratefully acknowledge the funding provided by the Basque Government to the ADVICE project through the Emaitek programme and the **funding through the research group IT781-13**, shared between the University of the Basque Country (UPV/EHU) and Tecnalía.

My thanks also go to Dr. Takeyuki Okubo, Dr. Kim Dowon, Dr. Rohit Jigyasu for the opportunity to join their team and to access to their research facilities at the Ritsumeikan University and to Dr. Gabriele Pasqui at the Politecnico di Milano.

I thank my colleagues for the stimulating discussions, especially José Luis, Iñaki and Rosa, who shared their knowledge and enthusiasm in this project. I express my sincere gratitude to Leire, for her constant availability and for our interminable scientific dialogues even from afar. To my Phistghetto and R3I colleagues, who always encouraged me. *A tod@s un inmenso eskerrik asko.*

To Sonia and Rossana, who always inspired me from a professional and personal point of view. *Avere la possibilità di tornare a condividere momenti con voi mi ha riportato un fresco e giovane entusiasmo.*

Last but not least, I would like to thank my family and friends, especially my mother and Marta, for supporting me spiritually and for their constant presence, always in the right place at the right time. *Non ci sono parole che possano esprimere la mia gratitudine e il mio amore.* To Ade, who spent sleepless nights with me, for his logistical support and for being my most enthusiastic cheerleader. *Je suis fière et extrêmement chanceuse de t'avoir à mes côtés.* To Sghero, for bringing joy and happiness to my daily life. Al mio Babbo, che veglia su di me ogni giorno.

1.1 BACKGROUND

1.2 SCOPE OF THE RESEARCH

1.3 RESEARCH METHODOLOGY

1.4 SIGNIFICANCE AND MAIN CONTRIBUTIONS

1.5 STRUCTURE OF THE DOCUMENT

Cities are complex and interdependent systems, vulnerable to threats from natural hazards. Over recent years, increasingly numerous and extreme precipitation events and subsequent flood events have occurred, impacting on a large number of historic structures. Furthermore, sea-level rise and the increasing frequency of storms, have posed new challenges to historic assets located in coastal areas, increasing concern over risks due to weather patterns and global climate change.

Disaster risk reduction and climate change adaptation should therefore be seen as components of conservation management, requiring a deep understanding of the vulnerability of historic buildings to flooding and associated extreme rainfall events and sea-level rise.

Historic cities, through adaptive processes, have always shown resilience, combining mixed uses on a human scale, density and vibrancy. They carry an identity forged over generations, encourage participation, communication and intimate relationships between public and private spaces. They are models from which the designers of new urban planning strategies may learn. While respecting their cultural values, specific methods for evidence-based decision-making have to be adapted and developed, in order to manage the evolution of historic cities and to guide them towards new comfort and climate-related parameters.

This situation calls for an efficient and holistic decision-making approach for sustainable urban planning, based on information management, that integrates disaster risk reduction, climate change adaptation and cultural heritage conservation.
